MAT1022	6

**Course title in Lithuanian**

**MATEMATIKA 2**

**Course title in English**

**MATHEMATICS 2**

**Short course annotation in Lithuanian (up to 500 characters)**

Dalyko tikslas – supažindinti su matematinės analizės pagrindais. Kurse supažindinama su neapibrėžtinio, apibrėžtinio ir dvilypio integralo sąvokomis bei taikymais, eilučių tipais ir jų konvergavimo požymiais, interpolavimo pagrindais, kompleksinių skaičiai, Euklido algoritmu bei pirmos ir antros eilės diferencialinių lygčių sąvokomis ir sprendimo metodais.

**Short course annotation in English (up to 500 characters)**

This course aims to develop understanding in basic concepts of mathematical analysis. The course introduces concepts and applications of indefinite, definite and double integrals, types of series and their convergence tests, the basics of interpolation, complex numbers, Euclidean algorithm, concepts and solution methods of the first and second order differential equations.

**Prerequisites for entering the course**

Mathematics 1

**Course aim**

This course aims to develop understanding in basic concepts of mathematical analysis.

**Content**

No	Content (topics)
1.	The concept of indefinite integral. Direct integration. Integration by substitution. Integration by parts. Integration of rational functions. Integration of trigonometric functions.
2.	Area of a curvilinear trapezoid and the concept of definite integral. Properties of the definite integral. Newton–Leibniz formula. Integration by substitution for definite integrals. Integration by parts for definite integrals. Applications of definite integral. Numerical integration.
3.	Double integrals.
4.	Convergence of number series. Necessary condition for the convergence. Sufficient conditions for the convergence of the positive number series. Alternating series. Absolute convergence. Interval of convergence of the power series. Representation of functions as power series. Maclaurin and Taylor series.
5.	Polynomial and spline interpolation.
6.	Algebraic form and operations of complex numbers. Trigonometric form and operations of complex numbers. Exponential form and operations of complex numbers.
7.	Euclidean algorithm.
8.	Basic concepts of differential equations. First order differential equations with separable variables. First order homogeneous equations. First order linear equations. The simplest second order differential equations.

**Distribution of workload for students (contact and independent work hours)**

Lectures	<b>45 hours</b>
Practical work	<b>30 hours</b>
Individual students work	<b>85 hours</b>
Total:	<b>160 hours</b>

**Structure of cumulative score and value of its constituent parts**

Midterm exam – 25%, practical work (two tests) – 25%, final exam – 50%.
